

Week 4

Open Data Exploration

[Recurring Zoom link](#)

April 21, 2026

*Note that this course will be recorded 🎥

Meeting with instructor

If you would like to meet with me for 30 minutes to discuss your proposal, data sources, and python modules/libraries that may benefit your project, please email me. Otherwise, I will provide a detailed email with feedback, additional data sources, and python library modules and functions you will want to look into for your projects before the midterm on week 6. Send me an email if you would like to schedule an alternative time.

Hands on Lab

- First, grab the course material, and "pull" it into your JupyterHub space:
- [Git related](#)
- Note that you have to do this at the start of every lecture to get the latest material.

Lab: Part 1

Code review with open data
- Break

Lab: Part 2

Mapping arrests

**Assignments (due 11:59pm Monday,
April 28th the day before class)**

Mini Project Assignment

For this week's project assignment, submit a status report as a markdown file in your project repo. This will simply be graded as a "done" or "not done" and count towards your participation grade.

Instructions

Include the following sections:

- **Project title and link to proposal**
- **Role:** Give your project a title and how you will contribute to the project.
- **Status update:** Report on the general mood of your project, and provide details as to what is working, and what is not.
- **Data update:** Provide a short narrative on where you are with the data sources you will incorporate in your project. Provide links as necessary.
- **Concerns:** There should be a lot to be concerned about at this phase of the project. List those concerns and classify them as "Major concerns" and/or "Minor concerns."

Submit

Resubmit your updated proposal [here](#).

Individual Coding Assignment

The purpose of this week's coding assignment is for you to advance your coding in a direction that makes sense to you, and to the advancement of your group research project.

Instructions

- Use this week to review: redo, add, replace, review, and/or improve upon past assignments to get a better understanding of the materials and coding structures used
- Follow up on this week's lab: create maps for areas that advance your research
- Be pragmatic: combine elements from various labs to create unique outputs that specifically advance your research inquiry
- Be innovative: experiment with new datasets/features not covered in class (if this requires a new module/library not covered in class, consult with me first)

Instructions (cont'd)

This assignment can be as long or as short as you desire. It is meant to review and advance your understanding of course material. To submit:

- create a new Python 3 notebook for your assignment
- provide a title and explanatory description of what the purpose of the notebook is
- provide ample markdown cells (preferably before and after each code cell) that explains what you are going to do, and how you interpret the results)
- upload your notebook to your GitHub account

Assignment submission link

Submit a link to your notebook [here](#).
